

RestaurantOS

A single cloud platform that helps restaurants take orders, run their kitchen, and understand their business — starting with a QR code on the table.

01 · VISION

Mission

To help restaurants run faster, smarter, and more efficiently through one simple cloud-based platform.

Instead of building different software for different restaurants, the plan is to build **one product that every restaurant can use**. Restaurants simply create an account, upload their menu, place QR codes on tables, and start receiving digital orders.

The goal is to become the software that a restaurant opens every morning to manage its operations.

02 · THE PROBLEM

Why Restaurants Need This

Most local restaurants still face several operational issues — on both sides of the counter.

Customer Problems

- Waiting for menu cards
- Waiting for the waiter
- Wrong orders
- Long billing process
- No digital payment option from the table

Restaurant Problems

- Waiters forget orders
- Handwritten order slips
- Slow service during rush
- Difficulty changing menu prices
- No sales analytics or best-seller visibility
- No customer database

03 · THE SOLUTION

RestaurantOS

A SaaS platform where every restaurant receives its own dashboard — its own menu, QR codes, customers, orders, and reports — all running from the same application.

One shared product. Independent data for every restaurant that signs up.

04 · CUSTOMER JOURNEY

From Table to Feedback

- 1 Customer sits down at **Table 8** and sees a "Scan Here to Order" card.
- 2 Customer scans the QR code — the restaurant's menu opens instantly in the browser, **no app install required**.
- 3 Customer browses Starters, Main Course, Dessert, Beverages, and Offers.
- 4 Customer customizes the order — extra cheese, less spicy, no onion, special instructions.
- 5 Customer checks out with UPI, Card, Wallet, Cash, or Pay Later.
- 6 Order appears instantly inside the **Restaurant Dashboard** and the kitchen starts preparing.
- 7 Customer gets notified when the order is ready, then leaves feedback after the meal.

Order Status Pipeline

Received → Preparing → Ready → Served → Completed

05 · PRODUCT ARCHITECTURE

Four Applications, One Product

Instead of one monolithic screen, RestaurantOS is composed of purpose-built modules for each person in the restaurant.

CUSTOMER-FACING**Customer Interface (via QR)**

- Digital menu & categories
- Search & images
- Cart & order history
- Payment
- Live order tracking
- Feedback

OWNER LOGIN**Restaurant Admin Dashboard**

- Today's revenue & orders
- Pending / completed / cancelled orders
- Popular items & revenue graph
- Peak hours & customer database
- Coupons & offers
- Table & menu management
- Taxes, payments & reports
- Staff management

IN-KITCHEN SCREEN**Kitchen Display System**

- Order number & table number
- Itemized ticket (e.g. 2× Butter Naan, 1× Paneer Butter Masala)
- Time elapsed since order placed
- Accept / Preparing / Ready / Completed buttons

FLOOR STAFF**Waiter Dashboard**

- View tables
- Serve orders
- Take offline orders
- Collect cash
- Update table status

06 · USER ROLES

Permission Hierarchy

Each role in the system is granted a different level of access, escalating from the customer up to the restaurant owner.

07 · FEATURE SET

What the Platform Does

Area	Capabilities
Menu Management	Add/delete items, edit price, add images, mark unavailable, categories, veg/non-veg, offers, taxes
Orders	Live orders, scheduled orders, takeaway, dine-in, delivery, cancelled, refunded
Payments	UPI, cards, wallets, cash, split payment, partial payment, GST invoicing
Analytics	Revenue, orders, peak hours, best/worst seller, repeat customers, average bill, daily/monthly/yearly reports
Customer Management	Order history, favourite food, visit frequency, phone/email, birthday, reward points

08 · ONBOARDING

Restaurant Starter Kit

Every new customer receives a complete, ready-to-use setup — designed to feel premium from day one.

Physical Kit

- QR stand
- Table numbers
- QR stickers

Digital & Support

- Dashboard login
- Owner training
- Menu upload setup
- Ongoing support

09 · BUSINESS MODEL

Revenue Model

Setup Fee

A one-time onboarding fee covering setup, training, QR design, menu upload, and configuration.

Monthly Subscription

Recurring revenue, with plans that vary based on restaurant size and feature access.

Add-On Services

10 · LONG-TERM ROADMAP

Five Phases of Growth

PHASE 1**MVP**

Customer QR menu, restaurant dashboard, kitchen dashboard, payments, order management.

PHASE 2**Inventory**

Ingredients, suppliers, purchase orders, stock alerts.

PHASE 3**Reservations**

Table booking, waitlist, events, party booking.

PHASE 4**Loyalty**

Reward points, membership, referral system, coupons, gift cards.

PHASE 5**AI Features**

Sales forecasting, demand prediction, menu optimization, chat assistant, voice ordering, automatic reports, smart pricing suggestions.

Why SaaS Instead of Custom Software?

Custom Software

- Every client needs a different codebase
- Maintenance becomes difficult
- Growth depends on constantly finding new clients

SaaS Platform

- One shared codebase serves many restaurants
- New features benefit everyone
- Predictable subscription revenue
- Scales much faster

12 · RISK ASSESSMENT

Biggest Risks to Validate Early

! Some restaurants already use POS systems with similar capabilities.

! Staff and owners may resist changing familiar workflows.

! Internet outages can disrupt cloud-based ordering if there's no fallback.

! Payment failures and refunds need to be handled smoothly.

! Responsive customer support is essential, especially during restaurant hours.

These risks don't make the idea bad — they simply mean customer research and a reliable product are essential.

13 · GO-TO-MARKET

Launch Strategy

Rather than trying to sign up hundreds of restaurants immediately, the plan is deliberately staged:

- 1 Build a working MVP.
- 2 Approach 10–20 local restaurants.
- 3 Offer free or discounted pilots in exchange for honest feedback.
- 4 Improve the product based on real usage.
- 5 Collect testimonials and case studies.
- 6 Begin charging standard pricing once there's proof the product saves time or improves operations.

14 · FUTURE VISION

Beyond QR Ordering

RestaurantOS starts with QR ordering, but the long-term vision is broader.

- Restaurants manage their daily operations on the platform.
- Owners use analytics to make business decisions.
- Staff rely on the dashboards during service.
- Customers interact with the system on every visit.
- Additional services — inventory, loyalty, reservations, AI insights — make the platform increasingly valuable.

If that vision is achieved, this is no longer just software being sold —

it becomes **infrastructure that restaurants depend on every day.**
